### Abstract

**Objectives:** The separation axioms are about the use of Kasaj topology to distinguish disjoint sets and distinct points. **Methods:** Any two Kasaj topologically distinguishable points must be distinct, and any two separated points must be Kasaj topologically distinguishable. **Findings:** New classes of separation axioms in Kasaj topological space namely,  $KS_g$ ,  $KS_{gs}$  and  $KS_{sg}$  spaces by utilizing  $KS_g$ ,  $KS_{gs}$  and  $KS_{sg}$ -open and closed sets are introduced and studied. Several of their fundamental characterizations and their relationships with other corresponding kinds of spaces are discussed. **Novelty:** In our paper work using the relation among the spaces are graphically illustrated as direct graphs.

**AMS Subject Classifications:** 54A05, 54B05, 54A99

**Keywords:**  $KS$ -semi- $T_i$  ( $i \leq 4$ ) spaces;  $KS\alpha$ - $T_i$  ( $i \leq 4$ ) spaces;  $KSg$ - $T_i$  ( $i \leq 4$ ) spaces;  $KSgs$ - $T_i$  ( $i \leq 4$ ) spaces;  $KSsg$ - $T_i$  ( $i \leq 4$ ) spaces

### 1 Introduction

In 2020, Kashyap G. Rachchh and Sajeed I. Ghanchi<sup>(1)</sup> introduced a partial extension of microtopological space, namely Kasaj topological spaces. In the same year, Rachchh K. G., Ghanchi S. I., Soneji A. A., and Ghanchi S. I.<sup>(2)</sup> established the concepts of kasaj-closure and kasaj-interior and defined kasaj semi-closed and kasaj generalized closed sets in Kasaj topological spaces. In 2022, Prakash et al.<sup>(3)</sup> defined and studied the notions of  $KS_{gs}$ -closed and  $KS_{sg}$ -closed sets in Kasaj topological space. The classes  $KS_g$ ,  $KS_{gs}$  and  $KS_{sg}$ -open and closed sets play a vital role in the development of the generalization of Kasaj topological spaces. To further initiate new ideas on this paper, we refer to Abdelwaheb Mhemdi, Tareq M. Al-shami<sup>(4)</sup> which is introduced in year 2021, the concepts of functionally  $T_i$  space for  $i = 0, 1, 2$ . They study their main properties, especially those are related to product spaces and topological and hereditary properties. In 2022, Ferit Yalaz, Aynur Keskin ka ymakci<sup>(5)</sup>, initiated the concept of  $\sigma$ - $R_0$ -space and  $\sigma$ Ker $_{\Gamma}$  by using the  $\sigma$ -topology produced with the help of the ideal and local closure function. This investigation has made significant contributions to the theory of separation axioms in Kasaj topological spaces. The main goal of the present paper is to consider and study the new classes of spaces called  $KS_g$ ,  $KS_{gs}$  and  $KS_{sg}$  spaces by using the respective Kasaj open and closed sets, respectively. Several properties concerning

these kinds of spaces were presented. Also, the relationships among these spaces were investigated graphically, and examples were presented wherever necessary.

#### Preliminaries:

##### Definition:<sup>(1)</sup>

The Kasaj topology is defined by  $KS_R(X) = \{(K \cap S) \cup (K' \cap S') : K, K' \in \tau_R(X), \text{ fixed } S, S' \notin \tau_R(X), S \cup S' = U\}$

The Kasaj topology  $KS_R(X)$  satisfies the following postulates:

1.  $U, \phi \in KS_R(X)$
2. The union of elements of any sub collection of  $KS_R(X)$  is in  $KS_R(X)$
3. The intersection of any finite sub collection of elements of  $KS_R(X)$  is in  $KS_R(X)$

Then  $(U, \tau_R(X), KS_R(X))$  is called Kasaj Topological Spaces and the members of  $KS_R(X)$  are called Kasaj-open (KS-open) set and the complement of a Kasaj-open set is called a Kasaj-closed (KS-closed) set.

##### Definition:<sup>(1)</sup>

The Kasaj closure and the Kasaj interior of a set P is denoted by  $KS_{cl}(P)$  and  $KS_{int}(P)$  respectively. It is denoted by  $KS_{cl}(P) = \bigcap \{Q : P \subseteq Q, Q \text{ is KS-closed}\}$  and  $KS_{int}(P) = \bigcup \{Q : Q \subseteq P, Q \text{ is KS-open}\}$

##### Definition:<sup>(1)</sup>

For any two subsets P, Q of U in a Kasaj topological space  $(U, \tau_R(X), KS_R(X))$

- (i) P is a Kasaj-closed set iff  $KS_{cl}(P) = P$
- (ii) P is a Kasaj-open set iff  $KS_{int}(P) = P$
- (iii) If  $P \subseteq Q$ , then  $KS_{int}(P) \subseteq KS_{int}(Q)$  and  $KS_{cl}(P) \subseteq KS_{cl}(Q)$
- (iv)  $KS_{cl}(KS_{cl}(P)) = KS_{cl}(P)$  and  $KS_{int}(KS_{int}(P)) = KS_{int}(P)$
- (v)  $KS_{cl}(P) \cup KS_{cl}(Q) \subseteq KS_{cl}(P \cup Q)$
- (vi)  $KS_{int}(P) \cup KS_{int}(Q) \subseteq KS_{int}(P \cup Q)$
- (vii)  $KS_{cl}(P \cap Q) \subseteq KS_{cl}(P) \cap KS_{cl}(Q)$
- (viii)  $KS_{int}(P \cap Q) \subseteq KS_{int}(P) \cap KS_{int}(Q)$
- (ix)  $KS_{cl}(P) = [KS_{int}(P)]^c$
- (x)  $KS_{int}(P) = [KS_{cl}(P)]^c$

## 2 Methodology

In our paper work, the following methodologies are used: KSg- T0, KSgs- T0, KSsg- T0 spaces and KSg- T1, KSgs- T1, KSsg- T1 spaces. If we pair distinct points and then there exist KSg, KSgs, KSsg -open sets such that the distinct points belong to any one of the KSg, KSgs, KSsg -open sets in KSg- T0, KSgs- T0, KSsg- T0 spaces and KSg- T1, KSgs- T1, KSsg- T1 spaces. But in KSg- T2, KSgs- T2, KSsg- T2 spaces, if we take each pair of distinct points, and then there exists KSg, KSgs, KSsg -open sets such that the distinct points belong to any one of the KSg, KSgs, KSsg -open sets and so the intersection of two KSg, KSgs, KSsg -open sets is empty. Likewise, KSg- T3, KSgs- T3, KSsg- T3 spaces, if given an element and KSg, KSgs, KSsg -closed sets belong to a Kasaj topological space but element do not belong to KSg, KSgs, KSsg -closed sets and there exist distinct KSg, KSgs, KSsg -open sets, two of which contain elements in one KSg, KSgs, KSsg -open set and KSg, KSgs, KSsg -closed set in another KSg, KSgs, KSsg -open set. For KSg- T4, KSgs- T4, KSsg- T4 spaces, if given a pair of distinct KSg, KSgs, KSsg -closed sets, there exists disjoint KSg, KSgs, KSsg -open sets contained in a Kasaj topological space. This implies that KSg, KSgs, KSsg -closed sets contained in KSg, KSgs, KSsg -open sets.

## 3 Result and discussion

### 3.1 $KS_g$ -T<sub>i</sub>(i=0,1,2,3,4) spaces

In this section, we define and discuss some properties of  $KS_g$  -T<sub>0</sub>,  $KS_g$  -T<sub>1</sub>,  $KS_g$  -T<sub>2</sub>,  $KS_g$  -T<sub>3</sub> and  $KS_g$  -T<sub>4</sub> spaces in kasaj topological spaces and obtain some of their basic properties.

**Definition 3. 1.1.** A KS topological space  $(U, \tau_R(X), KS_R(X))$  is said to be

- (i)  $KS_g$ -T<sub>0</sub> spaces if given a pair of distinct points  $x, y \in U$  either  $\exists$  a  $KS_g$ -open set  $G \in KS_R(X) \ni x \in G, y \notin G$  or  $\exists$  a  $KS_g$ -open set  $H \in KS_R(X) \ni y \in H, x \notin H$ .
- (ii)  $KS_g$ -T<sub>1</sub> spaces if given a pair of distinct points  $x, y \in U$  with  $x \neq y$ ,  $\exists$  a  $KS_g$ -open set  $G, H \in KS_R(X) \ni x \in G, y \notin G; y \in H, x \notin H$ .

(iii)  $KS_g-T_2$  spaces if given a pair of distinct points  $x, y \in U$  with  $x \neq y$ ,  $\exists$  a  $KS_g$ -open set  $G, H \in KS_R(X) \ni x \in G, y \in H$ ;  $G \cap H = \emptyset$ .

(iv)  $KS_g-T_3$  spaces if given an element  $x \in U$  and a  $KS_g$ -closed set  $F \subseteq U \ni x \notin F$ ,  $\exists$  disjoint  $KS_g$ -open sets  $G_1, G_2 \subseteq U \ni x \in G_1, F \subseteq G_2$ .

(v)  $KS_g-T_4$  spaces if given a pair of disjoint  $KS_g$ -closed sets  $C_1, C_2 \subseteq U$ ,  $\exists$  disjoint  $KS_g$ -open sets  $G_1, G_2 \subseteq U \ni C_1 \subseteq G_1, C_2 \subseteq G_2$ .

**Example 3. 1.2.** Let  $U = \{a, b, c, d, e\}$  with  $U/R = \{\{c, d\}, \{b, e\}, \{a\}\}$  and  $X = \{a, b\} \subseteq U$ . Then  $\tau_R(X) = \{\emptyset, U, \{a\}, \{a, b, e\}, \{b, e\}\}$ . If we consider  $S = \{e\}$ ,  $S' = \{a, b, c, d\}$  then  $KS_R(X) = \{\emptyset, \{a\}, \{b\}, \{e\}, \{a, b\}, \{a, e\}, \{b, e\}, \{a, b, e\}, \{a, b, c, d\}, U\}$  and  $KS_g$ -open  $= \{\emptyset, \{a\}, \{b\}, \{c\}, \{d\}, \{e\}, \{a, b\}, \{a, c\}, \{a, d\}, \{a, e\}, \{b, c\}, \{b, d\}, \{b, e\}, \{c, e\}, \{d, e\}, \{a, b, c\}, \{a, b, d\}, \{a, b, e\}, \{a, c, e\}, \{a, d, e\}, \{b, c, e\}, \{b, d, e\}, \{a, b, c, d\}, \{a, b, c, e\}, \{a, b, d, e\}\}$

(i) Let  $d, e \in U, d \neq e \ni$  a  $KS_g$ -open set  $= \{a, d\} \ni d \in \{a, d\}$  and  $e \notin \{a, d\}$ .

(ii) From Exemplar 3.1.2(i) and  $\exists$  a  $KS_g$ -open set  $= \{b, e\} \ni e \in \{b, d\}$  and  $d \notin \{b, e\}$ .

(iii) From Exemplar 3.1.2 ((i)&(ii))  $\ni \{a, d\} \cap \{b, e\} = \emptyset$ .

(iv) Let  $e \in U, \{a, d\} = KS_g$ -closed sets and  $e \notin \{a, d\} \ni \{c, e\}$  and  $\{a, b, d\} = KS_g$ -open sets  $\ni e \in \{c, e\}$  and  $\{a, d\} \subseteq \{a, b, d\}$ .

(v) Let  $\{c\}$  and  $\{d\} = KS_g$ -closed sets where  $\{c\} \cap \{d\} = \emptyset$  and  $\{a, c\}$  and  $\{b, d\} = KS_g$ -open sets where  $\{a, c\} \cap \{b, d\} = \emptyset$  and  $\{d\} \subseteq \{b, d\}$ .

**Theorem 3. 1.3.** If  $U$  is  $KS_g-T_0$  space and  $V$  is a subspace of  $U$  then  $V$  is also  $KS_g-T_0$  space.

**Proof:** Let  $U$  be  $KS_g-T_0$  space and  $V$  be a subspace of  $U$ . To show that  $V$  is  $KS_g-T_0$  space, let  $x, y \in V$  with  $x \neq y$ . Since  $V \subseteq U$ , we have  $x, y \in U$ . But  $U$  is  $KS_g-T_0$  space. So  $\exists$  a  $KS_g$ -open set  $G \ni G$  contains only one point  $x \in G$  and  $y \notin G$  then  $V \cap G$  is a  $KS_g$ -open set in  $V \ni x \in V \cap G$  and  $y \notin V \cap G$ . Hence  $V$  is  $KS_g-T_0$  space.

**Theorem 3.1.4.** A  $KS$  topological space  $U$  is a  $KS_g-T_0$  space iff  $KS_g$ -closure of distinct points are distinct.

**Proof:** Let  $x$  and  $y$  be distinct points of  $U$ . Since  $U$  is  $KS_g-T_0$  space there exist a  $KS_g$ -open set  $G \ni x \in G$  and  $y \notin G$ . Consequently,  $U - G$  is a  $KS_g$ -closed set containing  $y$  but not  $x$ . But  $KS_{gcl}(y)$  is the intersection of all a  $KS_g$ -closed set containing  $y$ . Hence,  $y \in KS_{gcl}(y)$ . But  $x \notin KS_{gcl}(y)$  as  $x \notin (U - G)$ . Therefore,  $KS_{gcl}(x) \neq KS_{gcl}(y)$ . Conversely, let  $KS_{gcl}(x) \neq KS_{gcl}(y)$  for  $x \neq y$ . Then  $\exists$  at least one point  $z \in U \ni z \in KS_{gcl}(x)$  but  $z \notin KS_{gcl}(y)$ . We claim  $x \notin KS_{gcl}(y)$  because if  $x \in KS_{gcl}(y)$ ,  $x \subseteq KS_{gcl}(y)$  implies  $KS_{gcl}(x) \subseteq KS_{gcl}(y)$ . So,  $z \in KS_{gcl}(y)$ , which is a contradiction. Hence  $x \notin KS_{gcl}(y)$ , which implies  $x \in U - KS_{gcl}(y)$ , which is a  $KS_g$ -open set containing  $x$  but not  $y$ . Hence  $U$  is a  $KS_g-T_0$  space.

**Theorem 3.1.5.** A  $KS$  topological space  $U$  is  $KS_g-T_1$  space if and only if each one point set is  $KS_g$ -closed.

**Proof:** Assume that  $U$  is  $KS_g-T_1$  space. Let  $x \in U$ . Then for each  $y \in U - \{x\} \ni$  a  $KS_g$ -open set  $U \ni y \in U$  and  $x \notin U$ . Since,  $x \notin U$  the sets  $\{x\}$  and  $U$  are disjoint. i.e.,  $\{x\} \cap U = \emptyset$  that implies  $U \subseteq U - \{x\}$ . Thus,  $y \in U \subseteq U - x$  that implies  $U - \{x\}$  is a  $KS_g$ -open set that implies  $\{x\}$  is a  $KS_g$ -closed set. Conversely, assume that each one point set is  $KS_g$ -closed. Let  $x, y \in U$  with  $x \neq y$ . So,  $U - \{x\}$  is a  $KS_g$ -open set containing  $y$  and but not  $x$ . Also,  $U - \{y\}$  is  $KS_g$ -open containing  $x$  but not  $y$ . So  $U$  is  $KS_g-T_1$  space.

**Theorem 3.1.6.** Every subspace of  $KS_g-T_1$  space is  $KS_g-T_1$  space.

**Proof:** Let  $(U, \tau_R(X), KS_R(X))$  be  $KS_g-T_1$  space. Let  $(V, \tau_R(Y), KS_R^*(X))$  be a subspace of  $U$ .

Let  $x, y \in V$  with  $x \neq y$ . Since  $V \subseteq U$ , we have  $x, y \in U$ . Since  $U$  is  $KS_g-T_1$  space  $\exists$   $KS_g$ -open sets  $G$  and  $H$  such that  $x \in G, y \notin G$  and  $y \in H, x \notin H$ . Let  $I = V \cap G$  and  $J = V \cap H$ . Then  $I$  and  $J$  are  $KS_g$ -open sets in  $V$ . Also,  $x \in I, y \notin I$  and  $y \in J, x \notin J$ . So,  $V$  is  $KS_g-T_1$  space.

**Theorem 3.1.7.** A  $KS$  topological space  $U$  is  $KS_g-T_1$  space iff every finite subset of  $U$  is  $KS_g$ -closed in  $U$ .

**Proof:** Assume that  $U$  is  $KS_g-T_1$  space. Let  $G$  be a finite subset of  $U$ . Let  $G = \{x_1, x_2, \dots, x_n\}$ . Then  $G = \{x_1\} \cup \{x_2\} \cup \dots \cup \{x_n\}$  which is  $KS_g$ -closed, begin a finite union of  $KS_g$ -closed sets. Conversely, let each finite subset of  $U$  is  $KS_g$ -closed in  $U$ . Then  $\{x\}$  is  $KS_g$ -closed since it is finite. Since each singleton is  $KS_g$ -closed,  $U$  is  $KS_g-T_1$  space.

**Theorem 3.1.8.** A  $KS_g$ -closed subspace of  $KS_g-T_4$  space is  $KS_g-T_4$  space.

**Proof:** Let  $V$  be a  $KS_g$ -closed subspace of  $KS_g-T_4$  space. Let  $C_1$  and  $C_2$  are disjoint  $KS_g$ -closed subsets of  $V$ . Since  $V$  is  $KS_g$ -closed in  $U$ ,  $C_1$  and  $C_2$  are also  $KS_g$ -closed in  $U$ . There exist disjoint  $KS_g$ -open sets  $G$  and  $H$  in  $U$  such that  $C_1 \subseteq G$  and  $C_2 \subseteq H$ . Since  $V$  contains both  $C_1$  and  $C_2$ , we have  $C_1 \subseteq V \cap G, C_2 \subseteq V \cap H$  and  $(V \cap G) \cap (V \cap H) = \emptyset$ . Since,  $G$  and  $H$  are  $KS_g$ -open in  $X$ ,  $(V \cap G)$  and  $(V \cap H)$  are  $KS_g$ -open in  $V$ . Thus, in the subspace  $V$ , we have disjoint  $KS_g$ -open sets  $(V \cap G)$  containing  $C_1$  and  $(V \cap H)$  containing  $C_2$ . Hence the subspace  $V$  is  $KS_g-T_4$  space.

### 3.2 $KS_{gs}-T_i$ ( $i=0,1,2,3,4$ ) spaces

In this section, we define and discuss some properties of  $KS_{gs}-T_0, KS_{gs}-T_1, KS_{gs}-T_2, KS_{gs}-T_3$  and  $KS_{gs}-T_4$  spaces in kasaj topological spaces and obtain some of their basic properties.

**Definition 3. 2.1.** A  $KS$  topological space  $(U, \tau_R(X), KS_R(X))$  is said to be

- (i)  $KS_{gs}$ - $T_0$  spaces if given a pair of distinct points  $x, y \in U$  either  $\exists$  a  $KS_{gs}$ -open set  $G \in KS_R(X) \ni x \in G, y \notin G$  or  $\exists$  a  $KS_{gs}$ -open set  $H \in KS_R(X) \ni y \in H, x \notin H$ .
- (ii)  $KS_{gs}$ - $T_1$  spaces if given a pair of distinct points  $x, y \in U$  with  $x \neq y$ ,  $\exists$  a  $KS_{gs}$ -open set  $G, H \in KS_R(X) \ni x \in G, y \notin G; y \in H, x \notin H$ .
- (iii)  $KS_{gs}$ - $T_2$  spaces if given a pair of distinct points  $x, y \in U$  with  $x \neq y$ ,  $\exists$  a  $KS_{gs}$ -open set  $G, H \in KS_R(X) \ni x \in G, y \in H, G \cap H = \emptyset$ .
- (iv)  $KS_{gs}$ - $T_3$  spaces if given an element  $x \in U$  and a  $KS_{gs}$ -closed set  $F \subseteq U \ni x \notin F$ ,  $\exists$  disjoint  $KS_{gs}$ -open sets  $G_1, G_2 \subseteq U \ni x \in G_1, F \subseteq G_2$ .
- (v)  $KS_{gs}$ - $T_4$  spaces if given a pair of disjoint  $KS_{gs}$ -closed sets  $C_1, C_2 \subseteq U$ ,  $\exists$  disjoint  $KS_{gs}$ -open sets  $G_1, G_2 \subseteq U \ni C_1 \subseteq G_1, C_2 \subseteq G_2$ .

**Example 3. 2.2.** Let  $U = \{a, b, c, d, e\}$  with  $U/R = \{\{c, e\}, \{a, b\}, \{d\}\}$  and  $X = \{a, b, c\} \subseteq U$ . Then  $\tau_R(X) = \{\emptyset, U, \{a, b\}, \{c, e\}, \{a, b, c, e\}\}$ . If we consider  $S = \{a, d\}$ ,  $S' = \{b, c, e\}$  then  $KS_R(X) = \{\emptyset, \{a\}, \{b\}, \{a, b\}, \{a, d\}, \{c, e\}, \{a, b, d\}, \{a, c, e\}, \{b, c, e\}, \{a, b, c, e\}, \{a, c, d, e\}, U\}$  and  $KS_{gs}$ -open  $= \{\emptyset, \{a\}, \{b\}, \{c\}, \{e\}, \{a, b\}, \{a, c\}, \{a, d\}, \{a, e\}, \{b, c\}, \{b, e\}, \{c, e\}, \{a, b, c\}, \{a, b, d\}, \{a, b, e\}, \{a, c, d\}, \{a, c, e\}, \{a, d, e\}, \{b, c, d\}, \{b, c, e\}, \{b, d, e\}, \{a, b, c, d\}, \{a, b, c, e\}, \{a, b, d, e\}, \{a, c, d, e\}\}$

- (i) Let  $b, e \in U, b \neq e \ni$  a  $KS_{gs}$ -open set  $= \{b, c\} \ni b \in \{b, c\}$  and  $e \notin \{b, c\}$ .
- (ii) From Exemplar 3.2.2(i) and  $\exists$  a  $KS_{gs}$ -open set  $= \{a, e\} \ni e \in \{a, e\}$  and  $b \notin \{a, e\}$ .
- (iii) From Exemplar 3.2.2((i)&(ii))  $\ni \{b, c\} \cap \{a, e\} = \emptyset$ .
- (iv) Let  $c \in U, \{a, e\} = KS_{gs}$ -closed sets and  $c \notin \{a, e\} \ni \{b, c\}$  and  $\{a, d, e\} = KS_{gs}$ -open sets  $\ni c \in \{b, c\}$  and  $\{a, e\} \subseteq \{a, d, e\}$ .
- (v) Let  $\{a, d\}$  and  $\{b, e\} = KS_{gs}$ -closed sets where  $\{a, d\} \neq \{b, e\} \ni \{a, d\}$  and  $\{b, c, e\} = KS_{gs}$ -open sets where  $\{a, d\} \neq \{b, c, e\} \ni \{a, d\} \subseteq \{a, c\}$  and  $\{b, e\} \subseteq \{b, c, e\}$ .

**Theorem 3. 2.3.** Let  $U$  is  $KS_{gs}$ - $T_1$  space iff the intersection of all  $KS_{gs}$ -neighborhoods of any point  $x$  in  $U$  is the singleton  $\{x\}$ .

**Proof:** Assume that  $U$  is  $KS_{gs}$ - $T_1$  space. Let  $x \in U$ . Let  $G$  be the intersection of all  $KS_{gs}$ -neighborhoods of  $x$ . Let  $y$  be any point in  $U$  different from  $x$ . Since the space  $U$  is  $KS_{gs}$ - $T_1$  space.  $\exists$  a  $KS_{gs}$ -neighborhood  $N$  of  $x \ni y \notin N$ . Since  $y \notin N$ , we have  $y \notin G$  since  $G$  is the intersection of all  $KS_{gs}$ -neighborhoods of  $x$ . Since  $y \notin G$ , no point different from  $x$  is in  $G$ . Hence,  $G = \{x\}$ .

Conversely, assume that the intersection of all  $KS_{gs}$ -neighborhoods of  $p$  in  $U$  is  $p$ . To prove that,  $U$  is  $KS_{gs}$ - $T_1$  space, let  $x, y \in U$  with  $x \neq y$ . Let  $G = \cap \{\text{all } KS_{gs}\text{-neighborhoods of } x \text{ in } U\}$ . Then  $G = \{x\}$ . Let  $H = \cap \{\text{all } KS_{gs}\text{-neighborhoods of } y \text{ in } U\}$ . Then  $H = \{y\}$ . Since  $y \neq x$ , we have  $y \notin G$  that implies  $\exists$  a  $KS_{gs}$ -neighborhood  $P$  of  $x$  with  $y \notin P$ . Since  $x \neq y$ ,  $x \notin H$  that implies a  $KS_{gs}$ -neighborhood  $Q \ni y$  with  $x \notin Q$ . Hence  $U$  is  $KS_{gs}$ - $T_1$  space.

**Theorem 3. 2.4.** For a  $KS$  topological space  $U$ , each of the following statement are equivalent:

- (i)  $U$  is  $KS_{gs}$ - $T_1$  space.
- (ii) The intersection of all  $KS_{gs}$ -open sets containing the set  $G$  is  $G$ .
- (iii) The intersection of all  $KS_{gs}$ -open sets containing the point  $x \in U$  is  $\{x\}$ .

**Proof:** (i)  $\Rightarrow$  (ii) Suppose  $U$  is  $KS_{gs}$ - $T_1$  space. By Theorem (3.2.3) each singleton set is  $KS_{gs}$ -closed in  $U$ . Let  $G \subseteq U$ . Then for each  $x \in U - G$ ,  $\{x\}$  is  $KS_{gs}$ -closed in  $U$  and hence  $U - \{x\}$  is  $KS_{gs}$ -open. Clearly,  $G \subseteq U - \{x\}$  for each  $x \in U - G$ . Therefore  $G \subseteq \cap \{U - \{x\} : x \in U - G\}$ . On the other hand, if  $y \notin G$  then  $y \in U - G$  and  $y \notin U - \{y\}$ . Therefore,  $y \notin \cap \{U - \{x\} : x \in U - G\} \subseteq G$ . Therefore, the intersection of all  $KS_{gs}$ -open sets containing the set  $G$  is  $G$ .

(ii)  $\Rightarrow$  (iii) Suppose the intersection of all  $KS_{gs}$ -open sets containing the set  $G$  is  $G$ . Take  $G = \{x\}$ . Then  $G = \{x\} = \cap \{H : H \text{ is } KS_{gs}\text{-open and } x \in H\}$ . Therefore, the intersection of all  $KS_{gs}$ -open sets containing the point  $x \in U$  is  $\{x\}$ .

(iii)  $\Rightarrow$  (i) Let  $x, y \in U$  and  $y \neq x$ . Then  $y \notin \{x\} = \cap \{H : H \text{ is } KS_{gs}\text{-open and } x \in H\}$ . Hence,  $\exists$  a  $KS_{gs}$ -open set  $H$  containing  $x$  but not  $y$ . Similarly,  $\exists$  a  $KS_{gs}$ -open set  $H$  containing  $y$  but not  $x$ . Thus,  $U$  is  $KS_{gs}$ - $T_1$  space.

**Theorem 3. 2.5.** Each singleton set in space is  $KS_{gs}$ -closed.

**Proof:** Let  $U$  be  $KS_{gs}$ - $T_2$  space. Since  $U$  is  $KS_{gs}$ - $T_2$  space. This  $\Rightarrow U$  is  $KS_{gs}$ - $T_1$  space.

$\Rightarrow \{x\}$  is  $KS_{gs}$ -closed for  $x \in U$ . Hence, each singleton set in  $KS_{gs}$ - $T_2$  space is  $KS_{gs}$ -closed.

**Theorem 3.2.6.** A subspace of  $KS_{gs}$ - $T_2$  space is  $KS_{gs}$ - $T_2$  space.

**Proof:** Let  $V$  be a subspace of  $KS_{gs}$ - $T_2$  space  $U$ . Let  $p, q \in V$  with  $p \neq q$ . Then  $p, q \in U$ .

Since  $U$  is  $KS_{gs}$ - $T_2$  space,  $\exists$   $KS_{gs}$ -open sets  $G$  and  $H$  such that  $p \in G, q \in H$  and  $G \cap H = \emptyset$ . Thus, we have  $G \cap H, H \cap V$  are  $KS_{gs}$ -open in  $V$ ,  $(G \cap V) \cap (H \cap V) = \emptyset$ .  $p \in G \cap V$  and  $q \in H \cap V$ . Hence  $V$  is  $KS_{gs}$ - $T_2$  space.

**Theorem 3. 2.7.** In any  $KS$  topological space, the following are equivalent:

- (i)  $U$  is  $KS_{gs}$ - $T_2$  space.
- (ii) For each  $x \neq y$ ,  $\exists$  a  $KS_{gs}$ -open set  $G \ni x \in G$  and  $y \notin KS_{gscl}(G)$ .
- (iii) For each  $x \in U$ ,  $\{x\} = \cap \{KS_{gscl}(U) : U \text{ is a } KS\text{-open set in } U \text{ and } x \in U\}$

**Proof:**

(i) $\Rightarrow$ (ii) Assume (i) holds. Let  $x, y \in U$  and  $x \neq y$ , then  $\exists$  disjoint  $KS_{gs}$ -open sets  $G$  and  $H \ni x \in G$  and  $y \in H$ . Clearly  $U - H$  is a  $KS_{gs}$ -closed set. Since  $G \cap H = \emptyset$ ,  $G \subseteq U - H$ . Therefore,  $KS_{gscl}(G) \subseteq KS_{gscl}(U - H) = U - H$ . Now  $y \notin U - H$  that implies  $y \notin KS_{gscl}(G)$ .

(ii) $\Rightarrow$ (iii) For each  $x \neq y \ni$  a  $KS_{gs}$ -open set  $G \ni x \in G$  and  $y \notin KS_{gscl}(G)$ . So  $y \notin \cap \{KS_{gscl}(G) : G \text{ is a } KS_{gs}\text{-open set in } U \text{ and } x \in G\} = \{x\}$ .

(iii) $\Rightarrow$ (i) Let  $x, y \in U$  and  $x \neq y$ . By hypothesis  $\exists$  a  $KS_{gs}$ -open set  $G \ni x \in G$  and  $KS_{gs}(G)$ . This implies  $\exists$  a  $KS_{gs}$ -closed set  $H \ni y \notin H$ . Therefore,  $y \in U - H$  and  $U - H$  is a  $KS_{gs}$ -open set. Thus,  $\exists$  two disjoint a  $KS_{gs}$ -open set  $G$  and  $U - H \ni x \in G$  and  $y \in U - H$ . Therefore,  $U$  is a  $KS_{gs}$ - $T_2$  space.

**Theorem 3. 2.8.** A space  $U$  is  $KS_{gs}$ - $T_4$  space iff for any a  $KS_{gs}$ -open set  $A$  containing a  $KS_{gs}$ -closed set  $F \ni$  a  $KS_{gs}$ -open set  $G \subseteq F \subseteq G \subseteq KS_{gscl}(G) \subseteq A$ .

**Proof:** Assume that  $U$  is  $KS_{gs}$ - $T_4$  space. Since  $F$  and  $A^c$  are disjoint and  $KS_{gs}$ -closed sets in  $U$ ,  $\exists$  disjoint  $KS_{gs}$ -open sets  $G$  and  $H \ni F \subseteq G$  and  $A^c \subseteq H$ . Since  $G$  and  $H$  are disjoint,  $G \subseteq H^c$ , we have  $KS_{gscl}(G) \subseteq H^c \subseteq A$ . Thus, we have a  $KS_{gs}$ -open set  $G \ni F \subseteq G \subseteq KS_{gscl}(G) \subseteq A$ . Conversely, assume that the condition holds. Let  $A$  and  $B$  be disjoint  $KS_{gs}$ -closed sets in  $U$ . Since  $B^c$  is  $KS_{gs}$ -open and contains a  $KS_{gs}$ -closed set  $A$  by assumption, there is a  $KS_{gs}$ -open set  $V \ni A \subseteq V \subseteq KS_{gscl}(V) \subseteq B^c$ . Thus, we have a  $KS_{gs}$ -open set  $V \supseteq A$  and  $[KS_{gscl}(V)]^c \supseteq B$ . so  $U$  is  $KS_{gs}$ - $T_4$  space.

### 3.3 $KS_{sg}$ - $T_i(i=0,1,2,3,4)$ spaces

In this section, we define and discuss some properties of  $KS_{sg}$ - $T_0$ ,  $KS_{sg}$ - $T_1$ ,  $KS_{sg}$ - $T_2$ ,  $KS_{sg}$ - $T_3$  and  $KS_{sg}$ - $T_4$  spaces in kasaj topological spaces and obtain some of their basic properties.

**Definition 3. 3.1.** A  $KS$  topological space  $(U, \tau_R(X), KS_R(X))$  is said to be

(i)  $KS_{sg}$ - $T_0$  spaces if given a pair of distinct points  $x, y \in U$  either  $\exists$  a  $KS_{sg}$ -open set  $G \in KS_R(X) \ni x \in G$ ,  $y \notin G$  or  $\exists$  a  $KS_{sg}$ -open set  $H \in KS_R(X) \ni y \in H$ ,  $x \notin H$ .

(ii)  $KS_{sg}$ - $T_1$  spaces if given a pair of distinct points  $x, y \in U$  with  $x \neq y$ ,  $\exists$  a  $KS_{sg}$ -open set  $G, H \in KS_R(X) \ni x \in G$ ,  $y \notin G$ ;  $y \in H$ ,  $x \notin H$ .

(iii)  $KS_{sg}$ - $T_2$  spaces if given a pair of distinct points  $x, y \in U$  with  $x \neq y$ ,  $\exists$  a  $KS_{sg}$ -open set  $G, H \in KS_R(X) \ni x \in G$ ,  $y \in H$ ,  $G \cap H = \emptyset$ .

(iv)  $KS_{sg}$ - $T_3$  spaces if given an element  $x \in U$  and a  $KS_{sg}$ -closed set  $F \subseteq U \ni x \notin F$ ,  $\exists$  disjoint  $KS_{sg}$ -open sets  $G_1, G_2 \subseteq U \ni x \in G_1$ ,  $F \subseteq G_2$ .

(v)  $KS_{sg}$ - $T_4$  spaces if given a pair of disjoint  $KS_{sg}$ -closed sets  $C_1, C_2 \subseteq U$ ,  $\exists$  disjoint  $KS_{sg}$ -open sets  $G_1, G_2 \subseteq U \ni C_1 \subseteq G_1$ ,  $C_2 \subseteq G_2$ .

**Example 3. 3.2.** Let  $U = \{a, b, c, d, e\}$  with  $U/R = \{\{c, d\}, \{b, e\}, \{a\}\}$  and  $X = \{a, e\} \subseteq U$ . Then  $\tau_R(X) = \{\emptyset, U, \{a\}, \{a, b, e\}, \{b, e\}\}$ . If we consider  $S = \{a, e\}$ ,  $S' = \{b, c, d\}$  then  $KS_R(X) = \{\emptyset, \{a\}, \{b\}, \{a, b\}, \{a, e\}, \{a, b, e\}, \{b, c, d\}, \{a, b, c, d\}, U\}$  and  $KS_{sg}\text{open} = \{\emptyset, \{a\}, \{b\}, \{a, b\}, \{a, e\}, \{b, c\}, \{b, d\}, \{a, b, c\}, \{a, b, d\}, \{a, b, e\}, \{a, c, e\}, \{a, d, e\}, \{b, c, d\}, \{b, c, e\}, \{b, d, e\}, \{a, b, c, d\}, \{a, b, c, e\}, \{a, b, d, e\}\}$

(i) Let  $a, b \in U$ ,  $a \neq b \ni$  a  $KS_{sg}$ -open set  $= \{a, e\} \ni a \in \{a, e\}$  and  $b \notin \{a, e\}$ .

(ii) From Exemplar 3.3.2(i) and  $\exists$  a  $KS_{sg}$ -open set  $= \{b, c\} \ni b \in \{b, c\}$  and  $a \notin \{b, c\}$ .

(iii) From Exemplar 3.3.2((i)&(ii))  $\exists \{a, e\} \cap \{b, c\} = \emptyset$ .

(iv) Let  $d \in U$ ,  $\{a, c\} = KS_{sg}$ -closed sets and  $d \notin \{a, c\} \ni \{b, d\}$  and  $\{a, c, e\} = KS_{sg}$ -open sets  $\ni d \in \{b, d\}$  and  $\{a, c\} \subseteq \{a, c, e\}$ .

(v) Let  $\{c\}$  and  $\{e\} = KS_{sg}$ -closed sets where  $\{c\} \neq \{e\} \ni \{b, c\}$  and  $\{a, e\} = KS_{sg}$ -open sets where  $\{b, c\} \neq \{a, e\} \ni \{c\} \subseteq \{b, c\}$  and  $\{e\} \subseteq \{a, e\}$ .

**Result 3.3.3.** From the definitions which is defined above, we observe that

(i) Every  $KS$ - $T_0$ ,  $KS$ -semi- $T_0$ ,  $KS_\alpha$ - $T_0$ ,  $KS_g$ - $T_0$  spaces are  $KS_{gs}(KS_{sg})$ - $T_0$  space.

(ii) Every  $KS$ -semi- $T_1$ ,  $KS_\alpha$ - $T_1$ ,  $KS_g$ - $T_1$  spaces are  $KS_{gs}(KS_{sg})$ - $T_0$  and  $KS_{gs}(KS_{sg})$ - $T_1$  spaces.

(iii) Every  $KS$ -semi- $T_2$ ,  $KS_\alpha$ - $T_2$ ,  $KS_g$ - $T_2$  spaces are  $KS_{gs}(KS_{sg})$ - $T_0$ ,  $KS_{gs}(KS_{sg})$ - $T_1$  and  $KS_{gs}(KS_{sg})$ - $T_2$  spaces.

(iv) Every  $KS$ -semi- $T_3$ ,  $KS_\alpha$ - $T_3$ ,  $KS_g$ - $T_3$  spaces are  $KS_{gs}(KS_{sg})$ - $T_0$ ,  $KS_{gs}(KS_{sg})$ - $T_0$ ,  $KS_{gs}(KS_{sg})$ - $T_2$  and  $KS_{gs}(KS_{sg})$ - $T_3$  spaces.

(v) Every  $KS$ -semi- $T_4$ ,  $KS_\alpha$ - $T_4$ ,  $KS_g$ - $T_4$  spaces are  $KS_{gs}(KS_{sg})$ - $T_4$ ,  $KS_{gs}(KS_{sg})$ - $T_1$ ,  $KS_{gs}(KS_{sg})$ - $T_2$ ,  $KS_{gs}(KS_{sg})$ - $T_3$  and  $KS_{gs}(KS_{sg})$ - $T_4$  spaces.

**Remark 3. 3.4.** The following graphs are directed graphs obtained from the above results in which the directed arc  $U \rightarrow V$  denotes that every  $U$  space is  $V$  space.

**Theorem 3. 3.5.** Let the topological space  $U$  is  $sg$ - $T_3$  space iff  $KS$  topological space  $U$  is  $KS_{sg}$ - $T_3$  space.

**Proof:** Suppose  $U$  is  $sg$ - $T_3$  space. Let  $x \in U$  and  $A \subseteq U$  is  $KS_{sg}$ -closed  $x \in U - A$ . Therefore,  $x \in U$  and  $A \subseteq U$ . Since  $U$  is  $sg$ - $T_3$  space,  $\exists$  disjoint  $sg$ -open sets  $G, H \in U$ .  $x \in G$  and  $A \subseteq H$ . This implies that  $x \in G$  and  $A \in H$ . Since  $G$  and  $H$  are disjoint  $sg$ -open sets, we have  $G \cap H = \emptyset$ . Thus,  $G \cap H = \emptyset$ . Hence,  $G$  and  $H$  are disjoint  $KS_{sg}$ -open sets. This implies that  $U$  is  $KS_{sg}$ - $T_3$

**Fig 1.**  $V_i$  ( $i = 1, 2, 3, 4$ ) ie.,  $V_1 \Rightarrow \text{KS-T}_0$ ,  $V_2 \Rightarrow \text{KS-semi-T}_0$ ,  $V_3 \Rightarrow \text{KS}\alpha\text{-T}_0$ ,  $V_4 \Rightarrow \text{KSg-T}_0$   $V_n$  ( $n = 5$ ) ie.,  $5 \Rightarrow \text{KS}_{gs}(\text{KS}_{sg})\text{-T}_0$

**Fig 4.**  $V_i$  ( $i = 1, 2, 3$ ) ie.,  $V_1 \Rightarrow \text{KS-semi-T}_3$ ,  $V_2 \Rightarrow \text{KS}\alpha\text{-T}_3$ ,  $V_3 \Rightarrow \text{KSg-T}_3$   $V_n$  ( $n = 4, 5, 6, 7$ ) ie.,  $V_4 \Rightarrow \text{KS}_{gs}(\text{KS}_{sg})\text{-T}_0$ ,  $V_5 \Rightarrow \text{KS}_{gs}(\text{KS}_{sg})\text{-T}_1$ ,  $V_6 \Rightarrow \text{KS}_{gs}(\text{KS}_{sg})\text{-T}_2$ ,  $V_7 \Rightarrow \text{KS}_{gs}(\text{KS}_{sg})\text{-T}_3$

**Fig 5.**  $V_i$  ( $i = 1, 2, 3$ ) i.e.,  $V_1 \Rightarrow \text{KS-semi-}T_4$ ,  $V_2 \Rightarrow \text{KS}_\alpha\text{-}T_4$ ,  $V_3 \Rightarrow \text{KS}_g\text{-}T_4$   $V_n$  ( $n = 4, 5, 6, 7, 8$ ) i.e.,  $V_4 \Rightarrow \text{KS}_{gs}(\text{KS}_{sg})\text{-}T_0$ ,  $V_5 \Rightarrow \text{KS}_{gs}(\text{KS}_{sg})\text{-}T_1$ ,  $V_6 \Rightarrow \text{KS}_{gs}(\text{KS}_{sg})\text{-}T_2$ ,  $V_7 \Rightarrow \text{KS}_{gs}(\text{KS}_{sg})\text{-}T_3$ ,  $V_8 \Rightarrow \text{KS}_{gs}(\text{KS}_{sg})\text{-}T_4$

space. Conversely, assume that  $U$  is  $\text{KS}_{sg}\text{-}T_3$  space. Let  $x \in U$  and  $A$  be  $\text{sg-closed}$  subset of  $U$ . Therefore,  $x \in U$  and  $A$  is  $\text{KS}_{sg}\text{-closed}$  in  $U$ . Since  $U$  is  $\text{KS}_{sg}\text{-}T_3$  space  $\exists$  disjoint  $\text{KS}_{sg}\text{-open}$  sets  $G$  and  $H \ni x \in G$  and  $A \subseteq H$ . Hence  $x \in G$  and  $A \subseteq H$ . This proves that  $U$  is  $\text{KS}_{sg}\text{-}T_3$  space.

**Theorem 3.3.6.** A subspace of  $\text{KS}_{sg}\text{-}T_3$  space is  $\text{KS}_{sg}\text{-}T_3$  space.

**Proof:** Let  $U$  be  $\text{KS}_{sg}\text{-}T_3$  space and  $V$  be a subspace of  $U$ . To prove that  $V$  is  $\text{KS}_{sg}\text{-}T_3$  space. Let  $P \in V$  and  $F$  be a  $\text{KS}_{sg}\text{-closed}$  set in  $V$  such that  $P \notin F$ . So,  $F = V \cap \text{KS}_{sgcl}(F)$ . Since  $P \notin F$ . We see that  $P \notin \text{KS}_{sgcl}(F)$ . Since  $U$  is  $\text{KS}_{sg}\text{-}T_3$  space, there exist disjoint  $\text{KS}_{sg}\text{-open}$  sets  $G$  and  $H$  in  $U$  such that  $\text{KS}_{sgcl}(F) \subseteq G$ ,  $P \in H$ . Now  $F \subseteq \text{KS}_{sgcl}(F) \subseteq G$ . Since  $F \subseteq V$ ,  $F \subseteq V \cap G$ . Since  $P \in V$  and  $P \in H$ ,  $P \in V \cap H$ . Further,  $(V \cap G) \cap (V \cap H) = \emptyset$ . since  $G \cap H = \emptyset$ . Thus,  $V \cap G$ ,  $V \cap H$  are  $\text{KS}_{sg}\text{-open}$  sets in  $V$ ,  $P \in V \cap H$ ,  $F \subseteq V \cap G$  and  $(V \cap G) \cap (V \cap H) = \emptyset$ . Hence,  $V$  is  $\text{KS}_{sg}\text{-}T_3$  space.

**Theorem 3.3.7.** A  $\text{KS}$  topological space  $U$  is  $\text{KS}_{sg}\text{-}T_3$  space iff for any  $x \in U$  and  $\text{KS}_{sg}\text{-neighborhood}$   $N$  of  $x$ , there is a  $\text{KS}_{sg}\text{-open}$  set  $G \ni x \in G \subseteq \text{KS}_{sgcl}(G) \subseteq N$ .

**Proof:** Assume that  $U$  is  $\text{KS}_{sg}\text{-}T_3$  space and  $N$  is  $\text{KS}_{sg}\text{-neighborhood}$  of  $x$ . Then  $N^c$  is a  $\text{KS}_{sg}\text{-closed}$  set and  $x \notin N^c$ . Since  $U$  is  $T_3$  space, there exist disjoint  $\text{KS}_{sg}\text{-open}$  sets  $G$  and  $H \ni x \in G$  and  $N^c \subseteq H$ . So,  $H^c \subseteq N$ . Since  $G \cap H = \emptyset$ ,  $G \subseteq H^c \Rightarrow \text{KS}_{sgcl}(G) \subseteq H^c$ . Since  $H^c$  is a  $\text{KS}_{sg}\text{-closed}$  set. Thus,  $x \in G \subseteq \text{KS}_{sgcl}(G) \subseteq N$ . Conversely, assume that the given condition is satisfied. Let  $F$  be a  $\text{KS}_{sg}\text{-closed}$  set in  $U$  and  $x \notin F$ . Since  $F^c$  is  $\text{KS}_{sg}\text{-neighborhood}$  of  $x$ , by assumption there is a  $\text{KS}_{sg}\text{-open}$  set  $G \ni x \in G \subseteq \text{KS}_{sgcl}(G) \subseteq F^c$ . Thus, the disjoint  $\text{KS}_{sg}\text{-open}$  sets  $G$  and  $[\text{KS}_{sgcl}(G)]^c$  contains  $x$  and  $F$  respectively. Hence,  $U$  is  $\text{KS}_{sg}\text{-}T_3$  space.

**Theorem 3.3.8.** The statements given below are equivalent

- $U$  is  $\text{KS}_{sg}\text{-}T_3$  space
- For  $x \in U$  and each  $\text{KS}_{sg}\text{-open}$  neighborhood  $U \ni \text{KS}_{sg}\text{-neighborhood}$  of  $U$  such that  $\text{KS}_{sgcl}(N) \subseteq U$ .

**Proof:**

(i) $\Rightarrow$ (ii) Let  $U$  be  $\text{KS}_{sg}\text{-neighborhood}$  of  $x$ ,  $\exists G$  belong to  $\text{KS}_{sg}\text{-open}$  in  $U \ni x \in G \subseteq U$ . Now  $G^c$  belongs to  $\text{KS}_{sg}\text{-closed}$  in  $U$  and  $x \notin G^c$ . From (i)  $\exists P, Q$  disjoint a  $\text{KS}_{sg}\text{-open}$  set such that  $G^c \subseteq P$ ,  $x \in Q$ ,  $P \cap Q = \emptyset$ . So,  $Q \subseteq M^c$ . Now  $\text{KS}_{sgcl}(Q) \subseteq \text{KS}_{sgcl}(P^c) = G^c$  and  $G^c \subseteq P$ . This implies  $P^c \subseteq G \subseteq U$ . Therefore,  $\text{KS}_{sgcl}(Q) \subseteq U$ .

(ii) $\Rightarrow$ (i) Let  $\text{KS}_{sg}\text{-closed}$   $F$  in  $U$  and  $x \notin F$  or  $x \in F^c$  and  $U$  is  $\text{KS}_{sg}\text{-open}$  and so  $F^c$  is  $\text{KS}_{sg}\text{-neighborhood}$  of  $x$ . By hypothesis,  $\exists \text{KS}_{sg}\text{-open}$  neighborhood  $N \ni x \in N$ ,  $\text{KS}_{sgcl}(N) \subseteq F^c$ . This implies  $F \subseteq \{U - \text{KS}_{sgcl}(N)\}$  and  $N \cap \{U - \text{KS}_{sgcl}(N)\} = \emptyset$ . Thus,  $U$  is  $\text{KS}_{sg}\text{-}T_3$  space.

**Theorem 3.3.9.** Let  $U$  is  $\text{KS}_{sg}\text{-}T_3$  space iff for every  $G$  belongs  $\text{KS}_{sg}\text{-closed}$  in  $U$  and point  $p \in (U - G)$  then  $x \in U$ ,  $G \subseteq N$  and  $\text{KS}_{sgcl}(N) \cap \text{KS}_{sgcl}(U) = \emptyset$  where  $N$  and  $U$  are open sets.

**Proof:** Given that  $U$  is  $\text{KS}_{sg}\text{-}T_3$  space. Let  $G$  belongs to  $\text{KS}_{sg}\text{-closed}$  in  $U$  and  $U \not\subseteq G$ . Then  $p \in M$  and  $G \subseteq N$  and  $M \cap N = \emptyset$  where  $M$  and  $N$  are open sets. This implies  $M \cap \text{KS}_{sgcl}(N) = \emptyset$ . Since  $U$  is  $\text{KS}_{sg}\text{-}T_3$  space,  $p \in P$  and  $\text{KS}_{sgcl}(N) \subseteq Q$ ,  $P \cap N = \emptyset$  where  $P, Q$  are  $\text{KS}_{sg}\text{-open}$ . Also,  $\text{KS}_{sgcl}(P) \cap Q = \emptyset$ . Let  $V = M \cap P$  then  $p \in V$ ,  $G \subseteq N$  and  $\text{KS}_{sgcl}(N) \cap \text{KS}_{sgcl}(V) = \emptyset$  where  $N$ ,  $V$  are  $\text{KS}_{sg}\text{-open}$  in  $U$ . Conversely, suppose for all  $G$  belongs to  $\text{KS}_{sg}\text{-closed}$  in  $U$  and  $p \in (U - G)$ , we have  $p \in U$ ,  $G \subseteq N$  and  $\text{KS}_{sgcl}(N) \cap \text{KS}_{sgcl}(V) = \emptyset$  where  $N$ ,  $V$  are  $\text{KS}_{sg}\text{-open}$  sets. This implies  $p \in U$ ,  $G \subseteq N$ , and  $V \cap N = \emptyset$ . Therefore,  $U$  is  $\text{KS}_{sg}\text{-}T_3$  space.

**Theorem 3.3.10.** For a  $\text{KS}$  topological space  $U$  the following are equivalent

- $U$  is  $\text{KS}_{sg}\text{-}T_3$  space
- For every a  $\text{KS}_{sg}\text{-open}$  set  $G$  is a union of  $\text{KS-semi}$  clopen sets.
- For every a  $\text{KS}_{sg}\text{-closed}$  set  $A$  is an intersection of  $\text{KS-semi}$  clopen sets

### Proof:

(i)  $\Rightarrow$  (ii) Let  $G$  be a  $KS_{sg}$ -open set and  $x \in G$ . If  $A = U - G$ , then  $A$  is a  $KS_{sg}$ -closed set. By assumption there exists disjoint  $KS$ -semi open subsets  $P$  and  $Q$  of  $U$  such that  $x \in P$  and  $A \subseteq Q$ . If  $H = scl(P)$ , then  $H$  is  $KS$ -semi clopen and  $H \cap A \subseteq H \cap Q = \emptyset$ . It follows that  $x \in H \subseteq G$ . Thus,  $G$  is a union of  $KS$ -semi clopen sets.

(ii)  $\Rightarrow$  (iii) This is obvious.

(iii)  $\Rightarrow$  (i) Let  $A$  be a  $KS_{sg}$ -closed set and  $x \notin A$ . By assumption, there exist  $KS$ -semi clopen set  $H$  such that  $A \subseteq H$  and  $x \notin H$ . If  $G = U - H$ , then  $G$  is  $KS$ -semi open set containing  $x$  and  $U \cap V = \emptyset$ . Thus,  $U$  is  $KS_{sg}$ - $T_3$  space.

**Theorem 3. 3.11.** For  $KS$  topological space  $U$  the following are equivalent:

(i)  $U$  is a  $KS_{sg}$ - $T_4$  space.

(ii) For every a  $KS_{sg}$ -closed set  $A$  and every a  $KS_{sg}$ -open set  $G$  containing  $A$ . There is a  $KS$ -semi clopen set  $H \ni A \subseteq H \subseteq G$ .

### Proof:

(i)  $\Rightarrow$  (ii) Let  $A$  be a  $KS_{sg}$ -closed set and  $G$  be a  $KS_{sg}$ -open set with  $A \subseteq G$ . Now we have  $A \cap (U - G) = \emptyset$ , hence  $\exists$  disjoint  $KS$ -semi open sets  $V_1$  and  $V_2 \ni A \subseteq V_1$  and  $U - G \subseteq V_2$ . If  $H = KS_{scl}(V_1)$ , then  $H$  is  $KS$ -semi clopen satisfying  $A \subseteq H \subseteq G$ .

(ii)  $\Rightarrow$  (i) This is obvious.

## 4 Conclusion

The class of  $KS$ -open and  $KS$ -closed sets has an important role to examine the separation axiom in kasaj topological space. In this work, we studied new types of separation axioms namely,  $KSg$ - $T_i$  ( $i=0,1,2,3,4$ ) spaces;  $KSgs$ - $T_i$  ( $i=0,1,2,3,4$ ) spaces and  $KSsg$ - $T_i$  ( $i=0,1,2,3,4$ ) spaces and the relation between spaces are discussed in new form, which are explained by direct graphs and named the vertices as  $V_1, V_2, V_3, V_4, V_5, V_6, V_7, V_8$  in the section 3. Several characterizations and the relation between properties of the above sets of separation axioms are discussed and proved. Furthermore, useful results are investigated by comparing  $KSgs(KSsg)$ - $T_3$  spaces and  $KSgs(KSsg)$ - $T_4$  spaces in the context of these new concepts.
